

ABSTRACT

The parking building is one of the supporting facilities for a city or building with a specific function for people who use private transportation to terminate it. In the midst of the mode of private transportation that is still dominated by the needs of the community, the growth in the number of private vehicle use in Indonesia each year triggers a problem, namely the lack of parking space in city spaces. The need for integration in areas that do not have parking facilities such as the old market tourist attraction in Tangerang with parking building facilities is expected to be the right solution to solve this problem, even though this solution is temporary and will trigger the growth in the use of private vehicles, the fact is seeing the current vehicle parking needs. we still need a functional parking building in urban areas.

Keywords: Parking building, ecological architecture, Pasar lama, Tangerang
